

Liquid UI: noscrollbar Command

This example illustrates the **noscrollbar** command. The **noscrollbar** command hides any scrollbars in SAP screens. It can be used to suppress or hide scrollbars within a specified area in a SAP screen. This is very useful if a user has deleted a large number of fields or other elements, making a scrollbar unnecessary. The scrollbar at the right-hand edge of the window is the lone exception to the command - it is not suppressed when using the **noscrollbar** command.

User Interface

Log in to SAP and navigate to transaction VD01, filling in data until you on the initial screen.
