# Liquid UI: Using dll Option in call Command

Purpose
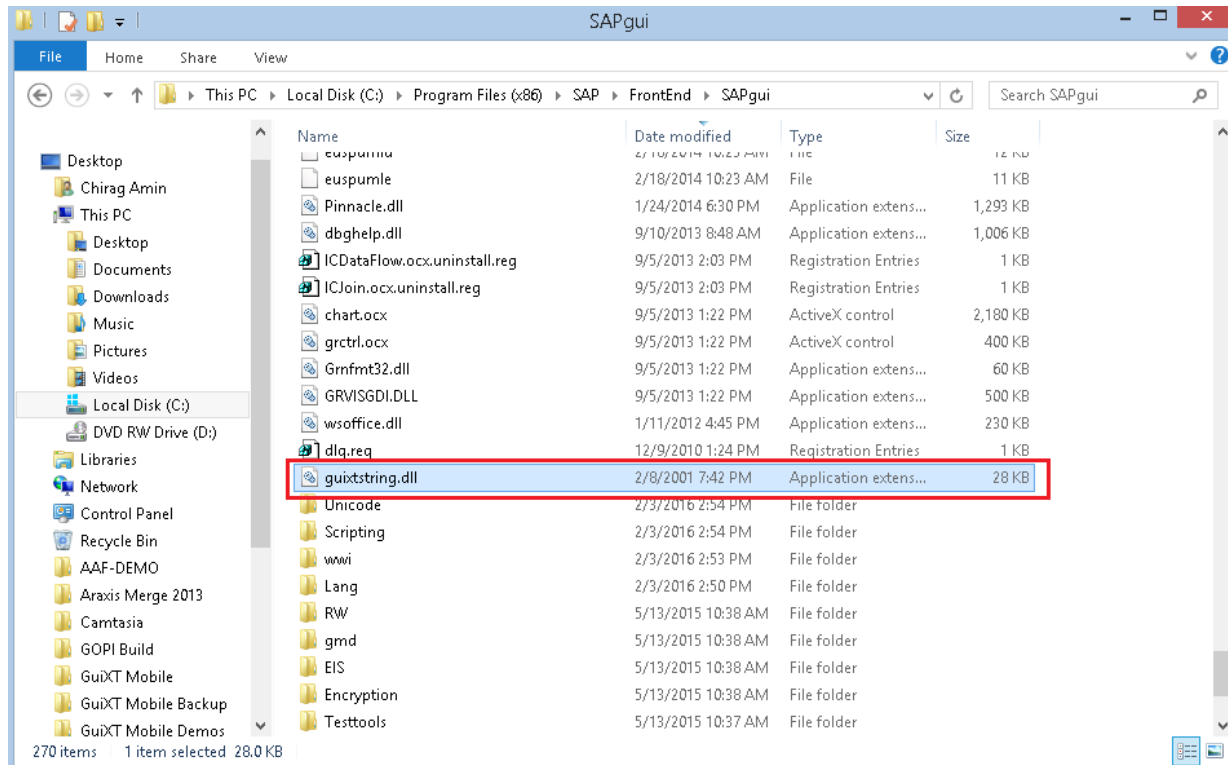

This forum article will show an example of how to use the "dll" option in the "call" command. With the "dll" option, we can use functions that exist in a .dll software file. We must include the .dll function in the SAPgui folder (e.g. "C:\Program Files (x86)\SAP\FrontEnd\SAPgui"). Depending on what function you are using, the parameters you pass will differ.

User Interface

Log into SAP and look at the title of the screen see view the result of our DLL function that ran.

The guixtstring.dll is placed in the SAPgui folder.

Liquid UI Code [Script]

```
1   // SAPLSMTR_NAVIGATION.E0100.sjs
2
3   // Use call command with DLL option to call a DLL function
4   call('alphanum', {"dll":"guixtstring", "In":"123","In.2":"6", "Out":"result"});
5   // RESULT should be "000123"
6   title("RESULT: "+result);
7
```
