Server Appendices

6.3.3 Configuring Liquid UI Server for SAPConsole

To configure the Liquid UI Server for a SAPConsole deployment, please do the following:

1. Install SAPConsole, the Telnet server of your choice, and GuiXT Server.
2. On the device, open SAPLOGON and create a new connection.
3. Enter a name for the connection in the Description field. We recommend something like 'GuiXT Server'.
4. Enter the name or IP address of the GuiXT Server in the Application Server field.
5. Select the type of system - R/3 or R/2. Most of the time it should be R/3.

6. Enter the system number in the System number field.

   Note: The system number is actually the listen port number as defined in the sapproxy.ini file.

7. Click OK to create the new connection.
